

#### How to use PERSISTENCE

PERSISTENCE uses the library file pg.dll, AllPictures.txt, and Input.txt. PERSISTENCE analyzes only those locations and species listed in Input.txt. PERSISTENCE makes a table of how long a species stays at the camera locations. In essence, PERSISTENCE produces a probability density function of a species visit to a location. Included in the output is a maximum times a species strays at a location, the average length of a stay, and the number of minutes in which 98% of visits ended.
